8 Your 7-Day Plan

1 THE INTRODUCTION

You Are Not Alone In This

Why you feel the way you do — and why it makes complete sense

BEFORE YOU READ ANYTHING ELSE

Take a breath. Drop your shoulders. Whatever is happening right now — the silence, the hot and cold, the feeling that you keep getting this wrong — none of it means you are broken. It means your nervous systems are doing exactly what they were built to do. This guide is going to show you why, and what to do instead.

You're in a cycle that feels like a trap: you reach out, he goes cold, you wonder if you're the problem. Here's what's actually happening — his nervous system learned that closeness equals danger, and yours learned that love is something you have to earn and then fight to keep. Neither of you chose this wiring. Both of you can change it.

HERE IS THE SCIENCE

Your brain is wired to treat losing someone close the same way it treats physical danger. When they pull away or go cold, the alarm center in your brain fires. Your body floods with cortisol. The urgency feels real because it IS real — your nervous system is responding to a genuine threat signal. Brain scans show that rejection activates the same regions as physical pain. You are not being dramatic.

Eisenberger et al. (2003) · UCLA · Levine & Heller (2010), Attached

Rejection activates the same brain regions as pain

~10%

of adults are fearful-avoidant

~25%

have a dismissing avoidant style

WHY THE LOOP KEEPS REPEATING

Things Feel Good

Close, connected, hopeful

He Gets Overwhelmed

Closeness triggers his alarm

He Goes Cold

Days of silence, one-word texts

You Spiral

Reach, re-read texts, wonder why

Loop Repeats

Your reach triggers his retreat

WHY YOU CAN'T STOP THINKING ABOUT HIM

The hot-and-cold pattern is not just confusing. It is neurologically addictive. B.F. Skinner found that when rewards are unpredictable, your brain chases them harder, not less — the same mechanism that makes gambling addictive. You are not obsessed because you are weak. You are responding to a pattern that was designed to hook you.

Skinner (1957) · Variable Ratio Reinforcement · Fisher et al. (2005) · Romantic Love and Dopamine

2 KNOW YOUR WIRING

The Attachment Spectrum

Everyone is on a spectrum — not a fixed box. These are patterns, not permanent labels.

REMEMBER: IT'S A SPECTRUM, NOT A BOX

Your attachment style is a pattern, not a life sentence. Everyone falls somewhere on this line, and most people lean toward one side while having traits from others. You and Marcus are both leaning avoidant — just in different directions. The good news: every style can move toward the middle.

Anxious

~20%

Craves closeness. Worries it won't last.

When you feel disconnected, your nervous system sounds the alarm — fast. You reach out more, check in, and try to fix it. This isn't neediness. It's your attachment system doing exactly what it was built to do.

Fearful-Avoidant

~5–10%

Wants closeness. Also afraid of it.

You can feel pulled toward someone and pushed away at the same time. That's not confusion — that's two attachment systems running at once. You learned that closeness can be dangerous, so part of you wants it badly and part of you protects against it.

YOU

Secure

~50%

Comfortable with both closeness and independence.

Able to ask for what you need without panic, and give space without fear. Security isn't the absence of fear — it's knowing how to handle it. This is the direction everyone in this guide is moving toward.

Avoidant

~25%

Values independence. Pulls back when things get close.

When emotional demands feel high, the instinct is to step back and create space. This isn't coldness — it's how they learned to cope. Closeness can feel overwhelming even with someone they genuinely care about.

THEM

WHY FA + DA IS SUCH A LOADED COMBO

Fearful-avoidant people carry both a deep need for closeness AND a fear of it. Dismissing avoidants have shut off their attachment system entirely to avoid the pain of depending on someone. When you reach for him, his nervous system says "threat." When he pulls back, your nervous system splits — part of you wants to chase, part of you wants to disappear too. Both responses are wired in. Neither is a character flaw.

Bartholomew & Horowitz (1991) · Main & Hesse (1990) · Levine & Heller (2010)

3

DECODE HIM

What's Actually Going On Inside Marcus

His behavior isn't random. Here is what's driving it — in plain English.

When Marcus disappears for three days after you told him you missed him, he is not punishing you. He is not testing you. His nervous system hit a threshold — closeness felt like too much — and the only tool he learned growing up was to create distance until it felt safe again. He wasn't taught to process feelings out loud. He was taught to handle things alone.

The word "needy" — that was a deflection, not a diagnosis. When someone with a dismissing avoidant style feels cornered by emotional intimacy, the easiest exit is to make the other person the problem. He probably didn't even think about how that word landed. He was just looking for space. That does not make it okay. But it does make it explainable — and explainable things can be worked with.

Here is what he actually needs, even if he cannot say it: a partner who stays steady when he pulls back. Not chasing, not punishing, not disappearing in return. Just warmth from a distance. When you can give him that — when your nervous system stays calm while he regulates — his system eventually reads you as safe. And safe people? They come back.

WHAT HE DOES — AND WHAT IT ACTUALLY MEANS

WHEN HE...	WHAT IT ACTUALLY MEANS	YOUR MOVE
<i>Disappears for 2–3 days after closeness</i>	He hit his threshold and needs space to decompress — not abandoning you, just regulating	Send one warm message. Then stop. Give him room to come back.
<i>Says "okay" to "I miss you" and goes quiet</i>	Your vulnerability scared him — not because he doesn't care, but because intimacy activates his alarm	Don't chase the silence. Let the warmth sit. His "okay" doesn't mean he felt nothing.
<i>Calls you "too needy" when you express a need</i>	He's deflecting pressure he can't handle yet — this is about his capacity, not your worth	"I'm not asking for a lot — I just need to know we're okay." One sentence. Then stop.
<i>Comes back warm like nothing happened</i>	He regulated, he missed you — this is real. His version of repair is just resuming, not processing.	Welcome him warmly. Save the processing conversation for a calm moment, not the price of return.

WHAT HE ACTUALLY NEEDS FROM YOU

- Space given freely — not as punishment, just as a gift
- Warmth without pressure or demand attached
- You staying calm when he pulls back
- Consistency — he learns you're safe by watching your patterns over time

WHAT MAKES IT WORSE

- Emotional urgency or intensity when he's already overwhelmed
- Multiple unanswered messages
- Demanding he explain the silence immediately on return
- Threats — even unmeant ones — that confirm closeness = danger

4 STOP THESE FIRST The Do Not React List

These feel like closeness to you. They feel like pressure to him. Every single time.

WHAT PROTEST BEHAVIORS ACTUALLY ARE

Bowlby called them protest behaviors: automatic actions your attachment system takes when it senses your person slipping away. They are not character flaws. They are ancient survival wiring. A baby cries and the caregiver comes back. That system is still running in you. The problem is that protest behaviors backfire with avoidant partners — they read emotional intensity as a threat and move further away, not closer.

THE 5 FORMS PROTEST TAKES — INCLUDING THE ONES YOU DON'T RECOGNIZE

1

Pursuit Escalation

The double text. The "are we okay?" follow-up. The long message explaining how his silence makes you feel. Each one feels necessary. To someone who pulls back, they register as pressure — and pressure triggers more distance, not less.

The rule: One message. Then you wait. The urgency you feel is a chemical state, not a deadline.

2

The Anger Protest

Picking a fight about something small when the real issue is disconnection. The anger is real, but the target is usually a stand-in for "I need you to acknowledge I exist." Any response — even a bad one — feels better than silence. But it confirms to him that closeness is dangerous.

The rule: Name what's actually happening. "I felt disconnected and it scared me" lands differently than a fight about plans.

3

Going Cold Yourself

Disappearing for a few days to see if he reaches out. It feels like taking back control. But it's still protest — you're trying to trigger his fear of losing you. The problem is avoidants often feel relief when the pressure lifts, which makes the silence even more painful for you.

The rule: Going cold to get a reaction is still the attachment system in protest mode. It rarely produces what you actually want.

4

The Ultimatum That Isn't Real

"Maybe we should just end this." Said not because you mean it, but because you need him to say he doesn't want that. To someone who shuts down, a threat to leave — even an unmeant one — is a reason to start preparing for exactly that.

The rule: Only say things you mean. Fake ultimatums erode trust on both sides.

5

Erasing Yourself to Not Trigger Him

You stop having needs. You agree to things that don't work for you. You make yourself smaller, hoping that if you stop triggering the pull-away, he'll finally stay. This doesn't create security. It creates resentment — and a version of you that's increasingly invisible.

The rule: Shrinking yourself isn't the same as being secure. You cannot earn consistent love by making yourself easier to leave.

“

Every protest behavior makes sense. Your nervous system is doing exactly what it was built to do. The goal is not to stop feeling it. The goal is to stop acting from it.

5 BEFORE YOU DO ANYTHING

Your Calm Switch

You cannot send a calm message from a panicking body. Fix your body first.

POLYVAGAL THEORY — YOUR NERVOUS SYSTEM HAS A RESET BUTTON

Dr. Stephen Porges showed that your vagus nerve runs from your brainstem down to your gut — and it controls whether your body is in panic mode or calm mode. The good news: you can manually switch it. Extending your exhale activates the parasympathetic system, which is literally your body's "safe" signal. A 2023 Stanford study found that one specific breath pattern outperforms every other real-time stress reduction technique ever tested.

Porges (2011) · Polyvagal Theory · Balban et al. (2023) · Stanford

THE PHYSIOLOGICAL SIGH — YOUR FAST RESET

HOW TO DO IT (TAKES 5 SECONDS)

- 1 Inhale through your nose — then sniff in a little more at the top
- 2 Exhale slowly through your mouth — make the exhale twice as long as the inhale
- 3 Repeat once or twice. Notice your shoulders drop. That's your vagus nerve.

THE 5-MINUTE RULE — BEFORE EVERY MESSAGE

THE PROTOCOL

Phone down. Breathe. 5 minutes. Then decide.

When you feel the urge to send a message — especially a follow-up to an unanswered one — put your phone face-down and set a timer for 5 minutes. Do the physiological sigh. After 5 minutes, ask yourself: "Am I sending this from a regulated body, or from panic?" Most of the time, you won't send it. When you do, it'll be the right version.

THE GROUNDING RESET

When you're spiraling — 5, 4, 3, 2, 1: Name 5 things you can see. 4 you can touch. 3 you can hear. 2 you can smell. 1 you can taste. Your nervous system can't be in the past and present simultaneously. This forces it present.

THE NAME-IT RESET

Say out loud: "I'm feeling anxious. My body thinks this is an emergency. It isn't." Naming an emotion reduces its intensity — this is called affect labeling, and it's one of the most evidence-backed regulation tools that exists. (Lieberman et al., 2007 · UCLA)

THE FA TRAP: THE DOUBLE ACTIVATION

Here's what's specific to your style: when Marcus pulls away, you don't just get anxious — you also get your own avoidant alarm activated. Part of you wants to chase, part of you wants to disappear. This is the FA double-bind. The regulation tools above are especially important for you because you're managing two conflicting impulse systems at once. Breathe first. Every time. Before anything.

6 EXACT WORDS Scripts That Actually Work

Built for your FA + his DA pattern. Say these from a regulated body.

HOW TO USE THESE

These scripts aren't word-for-word demands — they're a tone and a structure. You can adjust the words to sound like you. The key is the architecture: warmth without demand, a clear statement of your need, no punishment attached. All of them assume you've already regulated your body first.

SCRIPT 1 · WHEN HE'S BEEN SILENT FOR 2+ DAYS

THE SECURE SCRIPT

“Hey. No pressure — just thinking of you. I'm here when you're ready.”

Why this works: Warmth without demand. It signals you're not collapsing. Avoidants can receive this. It gives him permission to come back on his own timeline — which is the only timeline that actually works.

HOW THIS PLAYS OUT

... [3 days of silence]

Hey. No pressure — just thinking of you. I'm here when you're ready.

Send once. Phone down. Do not follow up.

SCRIPT 2 · WHEN HE COMES BACK LIKE NOTHING HAPPENED

THE SECURE SCRIPT

“Hey, good to hear from you. I missed you. Can we catch up properly soon?”

Why this works: You let him lead the return and gently insert your need — no punishment, no explosion, no pretending the silence was fine. You're welcoming him back AND signaling that connection matters to you. Both things at once.

HOW THIS PLAYS OUT

Hey what are you up to?

Hey, good to hear from you. I missed you. Can we catch up properly soon?

Don't lead with the silence. Warmth first, conversation later.

SCRIPT 3 · WHEN HE CALLS YOU "TOO NEEDY"

THE SECURE SCRIPT

“I hear that you needed space. I'm not trying to smother you. When I don't hear from you for a few days, I get scared something is wrong — that's just how I'm wired. Can we find something that works for both of us?”

 HOW THIS PLAYS OUT

You're being too needy, I just needed space.

I hear that. I'm not trying to smother you. When you go quiet for days I get scared something's wrong — that's just how I'm wired. Can we find something that works for both of us?

Calm. No blame. You've named the real thing.

SCRIPT 4 · TO NAME THE PATTERN WITHOUT ATTACKING

THE SECURE SCRIPT

"I don't want a fight. I've just been feeling disconnected and I wanted to say it instead of letting it build up."

Why this works: Low-temperature honesty. No chase, no ultimatum — just a clean, adult statement of your state. It models emotional openness without explosion. He can receive this because there's no demand attached.

 HOW THIS PLAYS OUT

Why are you always making everything a big deal?

I don't want a fight. I've just been feeling disconnected and I wanted to say it instead of letting it build.

One sentence. No follow-up. Let it land.

7 MORE SCRIPTS

When You Want More — and When You're Face to Face

For harder conversations and in-person moments.

SCRIPT 5 · WHEN YOU WANT TO KNOW WHERE THIS IS GOING

THE SECURE SCRIPT

"I like what we have. I'd love to feel like we're on the same page about where this is going."

Why this works: Direct without ultimatum. It invites him to step into clarity rather than cornering him. Only say this when you're regulated and actually ready to hear any answer.

SCRIPT 6 · AFTER A GOOD MOMENT — TO LOCK IN SAFETY

THE SECURE SCRIPT

"Today was really nice. This is what I want more of."

SCRIPT 7 · WHEN YOU FEEL YOURSELF STARTING TO SPIRAL

THE SECURE SCRIPT

"I'm going to give you some space right now. I'm here when you're ready."

Why this works: You regulate yourself by creating the space before he takes it. This breaks the cycle — instead of chasing until he retreats, you step back first from a place of choice, not panic. Say this out loud even if it's just to yourself.

SCRIPT 8 · WHEN HE ASKS WHAT'S WRONG

THE SECURE SCRIPT

"Honestly, I've felt a little disconnected this week. I'm not mad. I just wanted to tell you."

Why this works: Vulnerability without explosion. You give him something real and honest without making it a confrontation. He learns that your emotions don't require him to fix something or get defensive.

IN-PERSON SCRIPTS — WHEN YOU'RE FACE TO FACE

TO OPEN A HARDER CONVERSATION

"I want to talk about something but I don't want it to turn into a fight. Can we just talk?"

Wait for yes before continuing. His yes is him consenting to the conversation — that matters.

WHEN YOU FEEL DISTANCE IN THE ROOM

"I feel like we're not really connected right now. I don't know what to do with that — I just wanted you to know."

Pause after. Give him space to respond or just sit in it. You've named the thing without demanding a fix.

SETTING A LOW-PRESSURE EXPECTATION

"When I don't hear from you, I don't need a lot — just a 'busy today' is enough for me to not spiral."

Specific, small, actionable. Avoidants can meet small asks. Vague asks ("I just need more attention") hit their wall every time.

IF HE SHUTS DOWN MID-CONVERSATION

"We don't have to figure this out right now. I just wanted you to know where I was at."

Exit without escalating. You've planted the seed. Avoidants process on their own timeline — give him the room and he'll come back to it.

8

TAKE ACTION

Your Action Plan

Five things to start doing — and four to stop.

DO THESE

1

When you feel the urge to send a follow-up message, pause for 5 minutes first. Put your phone face-down. Do the physiological sigh. Most of the time the urge passes — and if it doesn't, you'll send a regulated version instead of

- 2 Name your feelings to yourself before you bring them to him. "I'm scared he's pulling away" is different from "I'm angry he's ignoring me." The first one gets said calmly. The second one comes out sideways. Know which one you're in before you open your mouth.
- 3 Practice one regulation technique from this guide before every difficult conversation — not after you're already flooding. The physiological sigh takes 5 seconds. There's no reason not to use it.
- 4 Notice and name the good moments. Avoidants are shaped by positive reinforcement more than they realize. "Today was really nice" tells him that closeness is safe. Say it out loud.
- 5 Decide your actual standard. What does consistency mean to you specifically? Write it down — not as an ultimatum, but as clarity for yourself. You can't hold a line you haven't drawn.

STOP DOING THESE

- ✗ Sending more than one unanswered message in a row — no matter how long the silence has been.
- ✗ Bringing up the pattern right after he comes back — that's the worst moment. Wait until you've had a good hour first.
- ✗ Explaining your feelings in paragraph form via text. Length registers as intensity. One sentence does more work than four paragraphs.
- ✗ Fake ultimatums. Only say "maybe we should end this" if you actually mean it. Even unmeant threats confirm to him that closeness equals danger.

EARNED SECURE ATTACHMENT — YOU CAN CHANGE

Attachment styles are formed in childhood but they are not permanent. Research shows that adults can build what scientists call Earned Secure Attachment — moving toward security through self-awareness, healthier relationships, and support. The work you are doing right now counts. Every time you regulate instead of react, you're rewiring the pattern.

Main (1990) · Adult Attachment Interview · Siegel (1999) · The Developing Mind

9

YOUR FIRST WEEK

The 7-Day Plan

Small, specific, daily. You don't fix this in one conversation — you fix it in small repeated choices.

HOW TO USE THIS

These aren't tasks to complete perfectly. They're directions to move in. If Day 3 lands on a day where everything goes sideways, do it on Day 4. This plan isn't about Marcus — it's about you building a new set of defaults. The

DAY 1

Re-read the "Decoding Your Partner" section. Find the one behavior in the translation table that happens most between you and Marcus. Write it down with your name on it. This is your starting map.

DAY 2

Practice the physiological sigh once — before you check your phone in the morning. Just once. Notice what one breath does to your baseline before the day starts.

DAY 3

Pick one script from pages 6–7 and decide the exact situation where you'd use it. Write it down: "I'll use Script 3 when he...". Having it pre-decided means you don't have to think under pressure.

DAY 4

Notice any protest behavior today — not to judge yourself, just to catch it. The moment you notice it, name it: "That's pursuit escalation. I'm going to put the phone down." You don't have to be perfect. Just witness it.

DAY 5

Use one script in a real moment. It doesn't have to be perfect — even 70% of Script 2 is better than the old pattern. Notice how it feels to say something true without it becoming a fight.

DAY 6

Spend 30 minutes doing something that has nothing to do with Marcus — something you were doing before you started focusing most of your energy here. Notice how that feels. The goal is to remember that you exist outside of this dynamic.

DAY 7

Write down one way this week felt different from the week before. Even something small: "I only sent one text instead of three." Progress is proof your nervous system can learn. Small counts.

A NOTE ON PROGRESS

You're not fixing him. You're changing the dynamic.

The goal isn't to get Marcus to behave differently in the next 7 days. The goal is to change what you do — which changes what the cycle has to work with. A different input produces a different output. And it starts with you, because you're the one who found this guide and did the work.

10

KNOW WHAT YOU'RE WATCHING FOR

The Standard Setter

Growth looks like specific things. So does a pattern that's not changing. Know both.

It's easy to hold onto hope for a relationship because of potential — what it could be, what it sometimes is. The standard setter is a reality check. Not to make you leave or stay, but to help you see clearly what's actually happening over time. Real change leaves evidence.

SIGNS HE'S ACTUALLY GROWING

- ✓ He acknowledges what happened instead of acting like nothing did — even if it's just "I know I went quiet, I'm sorry"
- ✓ He comes back with words AND follows through — not just warmth, but behavior that matches it
- ✓ The cycles get shorter over time — the silences are fewer days, not more
- ✓ He brings up the pattern himself, without you having to — this is the biggest one

BREADCRUMBS VS. CHANGE

- ✗ Acts warm and close but never names what happened — warmth without accountability isn't growth
- ✗ Says all the right things when you're about to leave, but behavior doesn't change afterward
- ✗ The cycle repeats with no apparent growth between rounds — same pattern, same timing, same resolution
- ✗ Gets defensive or vague every time you try to name the pattern — avoidance of the avoidance is still avoidance

THE STANDARD SETTER CONVERSATION

"I really care about what we have. I also need to feel like we're moving somewhere, not just repeating the same cycle. I'm not asking for everything at once. I'm asking to see us both trying."

Say this from a calm body. No ultimatum in your voice — just clarity. His response tells you a lot.

THE FA REMINDER

Your fearful-avoidant style can make it hard to trust what's real — both toward connection AND toward ending things that aren't working. If you find yourself reading breadcrumbs as growth, or dismissing actual growth as "too little too late," that's the wiring talking. Get grounded before you decide.

“You deserve someone who shows up as hard as you've been trying to. The goal is not to accept less. It's to know what more actually looks like — so you can recognize it when it's real.”

11

THE RESEARCH

The Science Behind Everything in This Guide

Every concept here is backed by peer-reviewed research. Here's the short version.

Levine & Heller (2010) built on Bowlby's and Ainsworth's work to show that attachment styles drive adult romantic behavior. The patterns in this guide — pursuit, withdrawal, the anxious-avoidant cycle — are well-documented. You are not the first person in this situation. And you are not broken.

Levine & Heller (2010) · Attached · Bowlby (1969) · Ainsworth (1978)

BRAIN SCANS · REJECTION HURTS LIKE PHYSICAL PAIN

Dr. Naomi Eisenberger used brain imaging to show that social rejection activates the same brain regions as physical pain. When they go cold, your body is responding to a real threat signal. The chest tightness, the stomach knot, the racing heart — all real. You are not being dramatic.

Eisenberger et al. (2003) · UCLA · Kross et al. (2011) · PNAS

POLYVAGAL THEORY · YOUR BODY'S CALM SWITCH

Dr. Stephen Porges showed that your vagus nerve plays a key role in regulating your stress response. When you extend your exhale, it shifts your body out of panic mode and into a calmer state. A 2023 Stanford study found the double-inhale breath pattern is one of the most effective real-time stress reducers ever tested.

Porges (2011) · Polyvagal Theory · Balban et al. (2023) · Stanford

INTERMITTENT REINFORCEMENT · WHY YOU CAN'T STOP THINKING ABOUT THEM

B.F. Skinner found that when rewards are unpredictable, the drive to chase them gets stronger, not weaker. This is called Variable Ratio Reinforcement — the same mechanism that makes gambling addictive. The hot-and-cold pattern is not just confusing. It is neurologically addictive.

Skinner (1957) · Reinforcement Schedules · Fisher et al. (2005) · Romantic Love Neuroimaging

EARNED SECURE ATTACHMENT · YOU CAN CHANGE

Attachment styles are formed in childhood but they are not permanent. Research shows that adults can build what scientists call Earned Secure Attachment — moving toward security through self-awareness, healthier relationships, and support. The work you are doing right now counts.

BEFORE YOU PUT THIS DOWN

A Note From Ash

What I want you to remember above everything else

THE BOTTOM LINE

You are not the problem. You are a person with a nervous system trying to love another person with a nervous system.

The FA + DA combination is one of the hardest pairings to navigate — not because it's impossible, but because both of you are running protection systems that directly conflict with each other's needs. His pull-back hits exactly the place where you're most wired to panic. Your reaching hits exactly the place where he's most wired to shut down. It's not bad luck. It's two nervous systems that never got the memo that it's safe now.

You can change the dynamic. Not by being perfect, not by saying the scripts word-for-word, not by never spiraling again. By doing it 10% differently than last time. Then 20%. The relationship follows the pattern you establish — and you just established a new one by reading this entire guide.

IF YOU WANT TO GO DEEPER

If you want to work through your specific situation 1:1 — the exact words to use, the moment you're in right now, the decision you keep circling — I do private calls. No fluff, no formula. Just us working through what's actually happening. The link is below.
